Assignment 2 Develop/Deploy Simple REST API

Using the to-do app template, create and deploy a simple REST API application.

- You can use .NET Web Api framework or any other framework (I.e Express, Flask, Nest.js, Spring Boot).
- Your backend needs to be publicly available with a swagger page.
- All data will be stored in memory database
- You can add functionality as you wish
- **We DO NOT need the frontend, we just need APIs and swagger**
- You can deploy your app to Azure, AWS, Vercel, Render or any hosting service you like. You can use AI to help in your deployment

Group 1 – Address Book

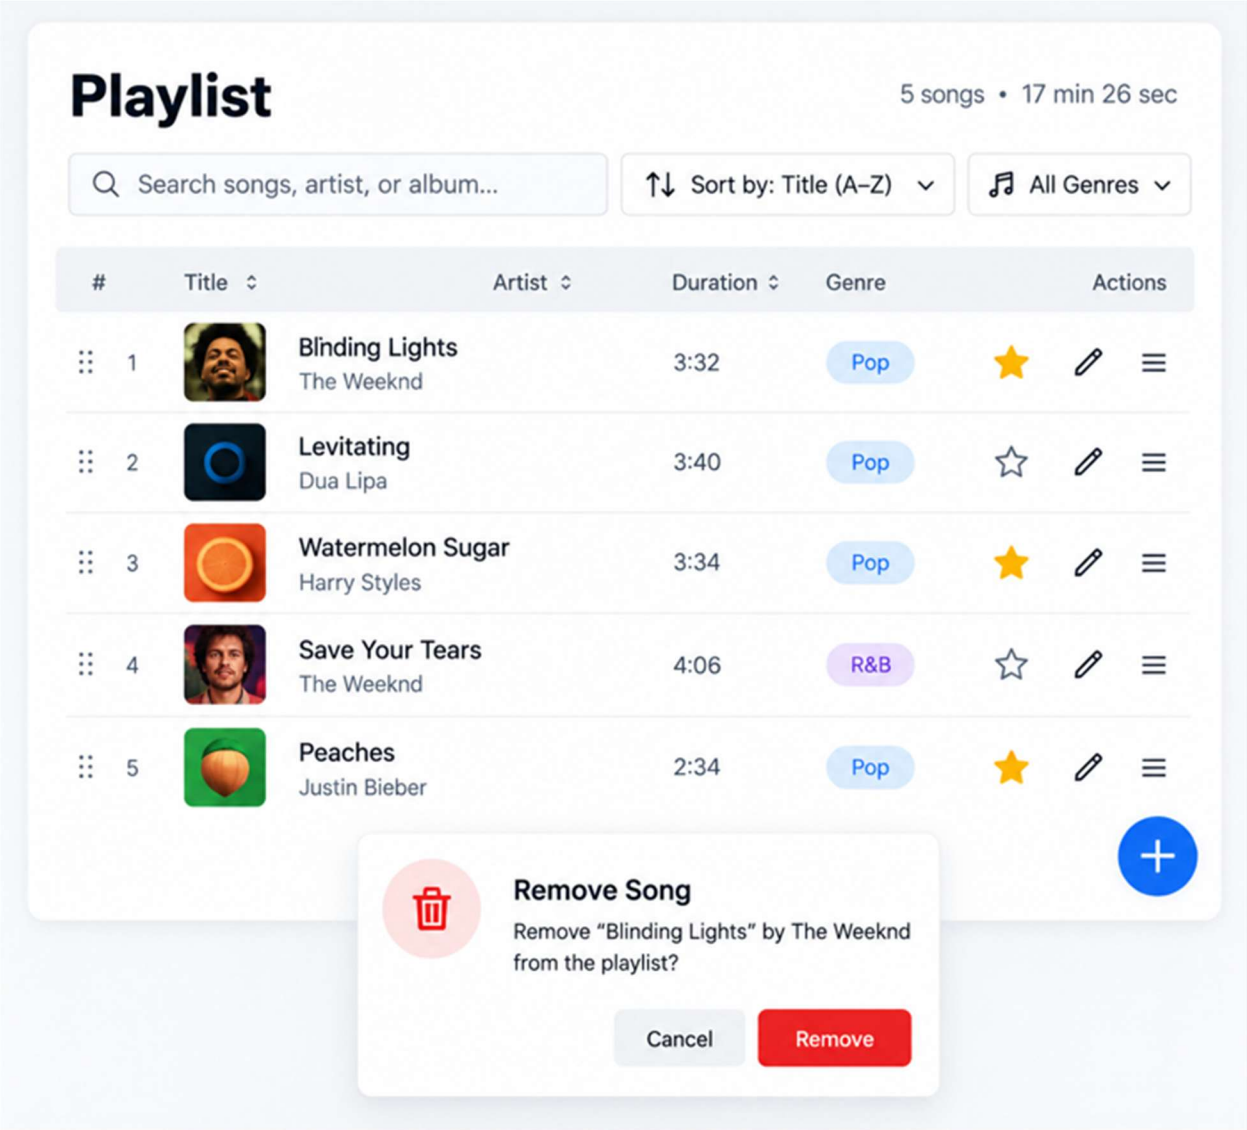

Create API endpoints for an address book to create, edit, delete, update, search, sort and favorite addresses.
